

MICROGRAPHIA.

Microscope, it appears a large body, cover'd with a tough reflecting skin very irregularly shrunk and pitted, in most an impossibility to find two of them wrinkled a ricty may there be even in this little seed.

This, though it appear'd one of the most promising the naked eye, yet through the *Microscope* it appear'd a seed, which I therefore drew, that I might thereby make we are by the naked eye to judge of beauteous or less cal Objects; cutting some of them in sunder, I observed with a greenish yellow pulp, and to have a very thick tion to the pulp.

Observ. XXIX. Of the Seeds of T

These pretty fruits here represented, in the 18. s else, but nine several seeds of Tyme; they are a ing posture, both as to the eye and the light; nor are t actly of the same shape, there being a great variety bo figure of each seed; but they all agreed in this, that be a *Microscope*, they each of them exactly resembled a l dry'd; and this both in shape and colour. Some o rounder, of the shape of an Orange, as A and B, them a very conspicuous part by which they were stalk, and one of them had a little piece of stalk remain site side of the seed, you may perceive very plainly by copped and prominent, as is very usual in Lemmons, w are expres'd in D, E and F.

They seem'd each of them a little creas'd or wr very conspicuously furrow'd, as if the inward make of somewhat like that of a Lemmon also, but upon divi with a very sharp Pen-knife, and examining them a their make to be in nothing but bulk differing from th have a pretty thick coat, and all the rest an indifferent seem'd very close; so that it seems Nature does not v method in the manner of inclosing and preserving th the seed, in these very small grains, from that of Bean

The Grain affords a very pretty Object for the M Dish of Lemmons plac'd in a very little room; shoul be proportionably magnify'd to what this seed of Tym it appear as bigg as a large Hay-reek, and it would be see *Homers Iliads*, and *Homer* and all, cramm'd into su may perceive even in these small Grains, as well as in ous and carefull Nature is in preserving the seminal table bodies, in what delicate, strong and most conv
